

# CO<sub>2</sub>/Bi(111)

Theodoros E. Panagiotakopoulos

**Department  
of Physics**

UNIVERSITY OF CENTRAL FLORIDA

# Overview

## ① Motivation

## ② Computational Details

## ③ Configurations

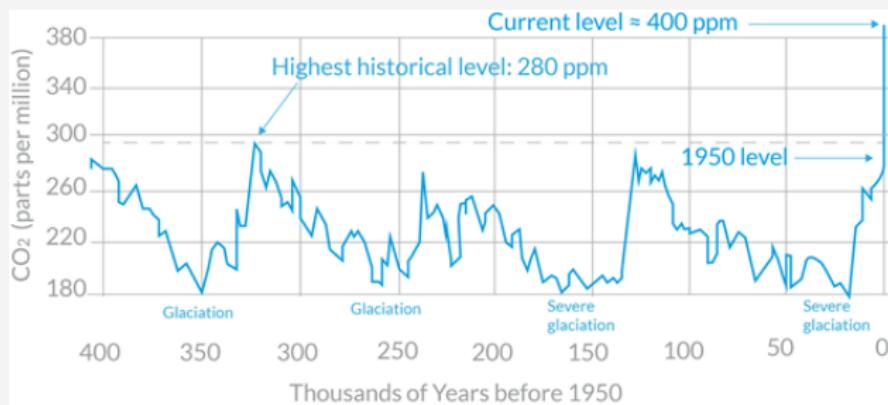

- CO<sub>2</sub> configurations
- CO<sub>2</sub>/Bi(111) configurations
- COOH/Bi(111) configurations
- CO<sub>2</sub> + NH<sub>4</sub><sup>+</sup>/Bi(111)

## ④ Next Steps

# Motivation

## (CO<sub>2</sub>) emissions

- The world watches out for carbon dioxide (CO<sub>2</sub>) emissions. The excess gas is the main cause of global warming due to the greenhouse effect.

# Computational Details

## Input parameters

- DFT, employing the projector-augmented wave (PAW) and the plane-wave basis set
- PBE exchange correlation function
- Kinetic energy cut-off: 500 eV
- Electronic convergence threshold:  $10^{-6}$  eV
- Supercell: 6x6x6 Bi(111) slab,
  - CO<sub>2</sub> atoms on both sides
  - Vacuum of 15 Å (For 1 ML Pb coverage: 216 Bi, 2 C, 4 O)
- Kpoint mesh: (1x1x1) for relaxation

# CO<sub>2</sub> configurations

CO<sub>2</sub>

- There are two configurations for CO<sub>2</sub>:
  - Two oxygen atoms up
  - Two oxygen atoms down

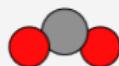

Figure 1: First configuration

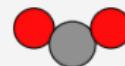

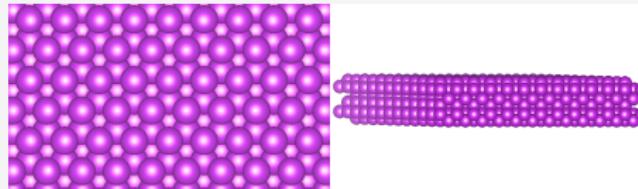

Figure 2: Second configuration

Absorb the two configurations of CO<sub>2</sub> on Bi(111)

# CO<sub>2</sub>/Bi(111) configurations

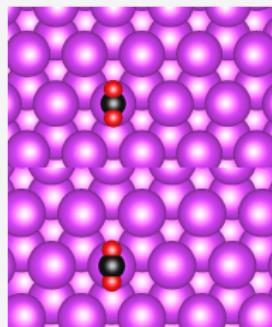

Figure 3: First configuration

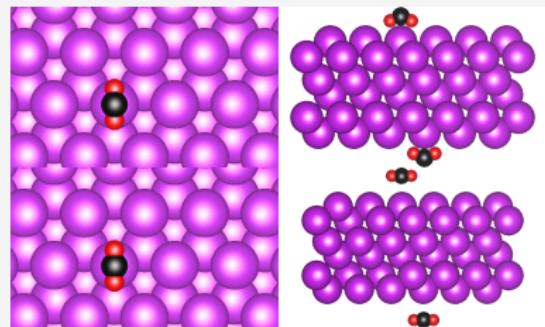

Figure 4: Second configuration

## CO<sub>2</sub>/Bi(111) absorbtion

- Calculations were pefromed for 0, 2 and 4 electrons
- It seems that CO<sub>2</sub> is not being on Bi(111)

# CO<sub>2</sub>/Bi(111) configurations

## Why charge?

- CO<sub>2</sub> is stable molecule and hard to adsorb on anything
- Adsorption happens only if it forms a v shape configuration
- This can happen only if CO<sub>2</sub> receive electron to its  $\pi$  antibonding orbital
- So charging the surface increase the amount of electron transferring to  $\pi^*$  orbital

# CO<sub>2</sub>/Bi(111) configurations

## CO<sub>2</sub>

- CO<sub>2</sub> could not be absorbed on the surface
- two configurations of COOH used
- COOH may be absorbed on Bi(111)[1] so H will then be removed

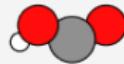

Figure 5: First configuration

Figure 6: Second configuration

# COOH/Bi(111) configurations

## COOH

- Calculations were performed for 0, 2 and 4 electrons
- We were able to absorb COOH on Bi(111)

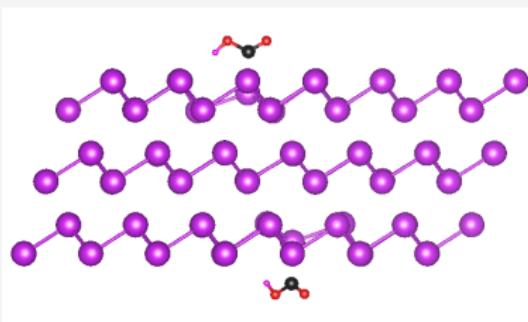

Figure 7: COOH absorbed on Bi(111)

- Next we remove H and we add cat-ion  $\text{NH}_4^+$

CO<sub>2</sub> + NH<sub>4</sub><sup>+</sup>/Bi(111)CO<sub>2</sub> + NH<sub>4</sub><sup>+</sup>/Bi(111)

- After trying many configurations finally we get the one where CO<sub>2</sub> stays bonded on Bi(111)
- Calculations were performed 1, 3 and -1 electrons
- C was initially constrained
- after relaxation, constraints were removed and new relaxation calculations performed

# CO<sub>2</sub> + NH<sub>4</sub><sup>+</sup>/Bi(111)

## CO<sub>2</sub> + NH<sub>4</sub><sup>+</sup>/Bi(111)

- CO<sub>2</sub> is bended for calculations with 1 e<sup>-</sup> added since this number gives approximately the potential of -1 eV used in experiments

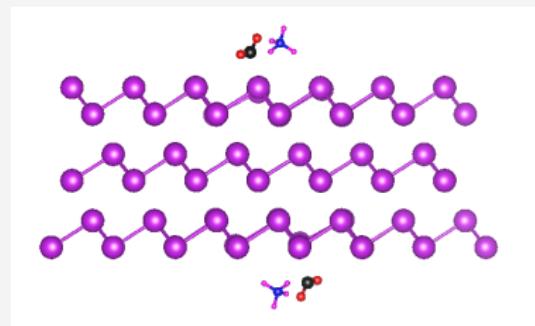

Figure 8: CO<sub>2</sub> & NH<sub>4</sub><sup>+</sup>/Bi(111) after relaxation

# Next Steps

## Next Steps

- Target potential calculations are running for NH<sub>4</sub><sup>+</sup> directly above C atoms
- NH<sub>4</sub><sup>+</sup> will be removed and see if CO<sub>2</sub> stays bonded by setting the target potential equal to -1 eV
- Use H<sub>2</sub>O instead of NH<sub>4</sub><sup>+</sup> and check if we can use H<sub>2</sub>O instead
